### Instrument List:

- [Green](#)

Discussion:

XPOL2 scan sequence was modified at 20130520-002919 UTC to re-include RHIs for vertical sampling of the upcoming storm. The new scan sequence is same as the default IFloodS scan sequence except for the following changes:

1. The RHI scan elevation range is 0-40 deg instead of 0-100 deg.
  2. The sector scans are wider: 60-300 deg instead of 60-200 deg in azimuth.
  3. The vertical point scan is less frequent: once every eight scan sequences instead of once every scan sequence.
